

## Polyurethane Bump Stops for Mountain Bike Suspension Systems

The one aspect of a mountain bike shock that is often overlooked, is the bump stop. The main reason to have a bump stop is that along with the shock damping, they help to control and absorb the ending stroke of the shock. In addition, they prevent the shock from having a harsh bottom out. The tapered designs help ease into the ending stroke of the shock, so the rider is safe and does not feel like they are hitting a wall.

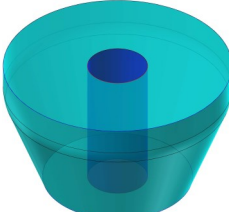

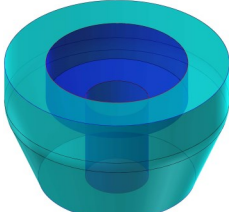

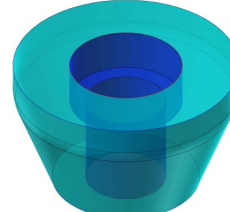

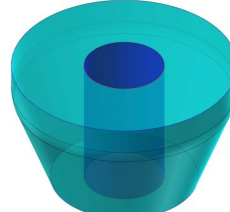

Together, Poly Labs and Fluid Focus have designed four different bump stops for use on most major mountain bikes.

### BUMP STOP DESIGN FEATURES:

- Oil and grease resistant
- High performance PU
- Superior rider protection
- 35 & 45 durometer options
- Custom designs available
- Support of all major mountain bike shock brands and OEMs
- Made in the USA
- Specialized formulations
- 4 standard cavity sizes
- Support for heavier riders
- Built for air and coil shocks

Each size and design (Cavities 1 - 4) is offered in two common durometers (35 & 45) to support the different weights of various riders. Our growing list of polyurethane bump stops to support shock system brands and OEMs includes:

CAVITY 1	CAVITY 2	CAVITY 3	CAVITY 4
